

Q1.

<p>4 $y = 6x - x^2$ Meets $y = 5$ when $x = 1$ or $x = 5$. Integral = $3x^2 - \frac{1}{3}x^3$ Their limits (1 to 5) used $\rightarrow 30\frac{2}{3}$ Area of rectangle = 20 Shaded area = $10\frac{2}{3}$</p> <p>(integral of $6x - x^2 - 5$ B1, M1, A1 DM1 as above, then “$-5x$” B1√ A1)</p>	<p>B1 M1 A1 DM1 B1√ A1 [6]</p>	<p>co attempt to integrate. co. value at top limit – value at lower co to his x values co</p>
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------

Q2.

<p>5 $\frac{dy}{dx} = \frac{6}{\sqrt{3x-2}}$</p> <p>(i) $x = 2$, tangent has gradient 3 \rightarrow normal has gradient $-\frac{1}{3}$ $\rightarrow y - 11 = -\frac{1}{3}(x - 2)$</p> <p>(ii) Integrate $\rightarrow 6 \frac{\sqrt{3x-2}}{\frac{1}{2}} \div 3$ $\rightarrow y = 4\sqrt{3x-2} + c$ through (2,11) $\rightarrow y = 4\sqrt{3x-2} + 3$</p>	<p>M1 M1 A1 [3]</p> <p>B1 B1 M1 A1 [4]</p>	<p>Use of $m_1 m_2 = -1$ with dy/dx Correct form of line eqn. for normal</p> <p>Without the $\div 3$ For $\div 3$, even if B0 above</p> <p>Using (2, 11) for c co</p>
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q3.

<p>9 $y = x + \frac{4}{x}$</p> <p>(i) $x + \frac{4}{x} = 5 \rightarrow A(1, 5), B(4, 5)$</p> $\frac{dy}{dx} = 1 - \frac{4}{x^2}$ <p>= 0 when $x = 2, M(2, 4)$.</p> <p>(ii) Vol of cylinder = $\pi 5^2 \cdot 3$ Vol under curve = $\pi \int y^2 dx$</p> $\text{Integral} = \frac{x^3}{3} - \frac{16}{x} + 8x$ <p>Uses his limits "1 to 4" $\rightarrow 75\pi - 57\pi - 18\pi$</p>	<p>B1 B1</p> <p>M1</p> <p>DM1 A1 [5]</p> <p>B1</p> <p>M1</p> <p>A2, 1, 0</p> <p>DM1 A1 [6]</p>	<p>co. co.</p> <p>Differentiates.</p> <p>Setting to 0. co.</p> <p>Any valid method.</p> <p>Attempt at integrating y^2</p> <p>Allow if no π present.</p> <p>Using his limits. co.</p>
-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q4.

<p>3 (i) Correct shape – touching positive x-axis</p> <p>(ii) $(\pi) \int (x-2)^4 dx$</p> $(\pi) \left[\frac{(x-2)^5}{5} \right]$ $(\pi) [0 - (-32)/5]$ $\frac{32\pi}{5} \text{ or } 6.4\pi$	<p>B1</p> <p>M1</p> <p>A1</p> <p>M1</p> <p>A1</p> <p>[4]</p>	<p>Ignore intersections with axes</p> <p>Use $(\pi) \int y^2 dx$ & attempt integrate but expansion before integ needs 5 terms</p> <p>Use of limits 0, 2 on <i>their</i> $(\pi) \int y^2 dx$ cao Rotation about y-axis max 1/5</p>
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q5.

<p>7 (i) $\frac{3(1+2x)^{-1}}{-1} + (c)$</p> $y = \frac{3(1+2x)^{-1}}{-2} + (c)$ <p>Sub (1, (1/2))</p> $\frac{1}{2} - \frac{3}{-6} + c \Rightarrow c = 1$ <p>(ii) $(1+2x)^2 (>) 9$ or $4x^2 + 4x - 8 (>) 0$ OE 1, -2 $x > 1, x < -2$ ISW</p>	<p>B1</p> <p>B1(indep)</p> <p>M1</p> <p>A1</p> <p>[4]</p> <p>M1</p> <p>A1</p> <p>A1</p> <p>[3]</p>	<p>Division by 2 $y =$ necessary</p> <p>Dependent on c present</p> <p>Use of $y = mx + c$ etc. gets 0/4</p>
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------

Q6.

<p>9 $\frac{dy}{dx} - \frac{2}{\sqrt{x}} - 1$ $P(9, 5)$</p> <p>(i) $y - 4\sqrt{x} - x (+c)$ Uses (9, 5) in an integrated expression $\rightarrow c = 2$</p> <p>(ii) $\frac{dy}{dx} - 0 \rightarrow x = 4, y = 6$</p> <p>(iii) $\frac{d^2y}{dx^2} - -x^{-3} \rightarrow -ve \rightarrow \text{Max}$</p> <p>(iv) $\frac{dy}{dx} - -\frac{1}{3}$ Perpendicular $m = 3$ $\tan\theta = 3$ Angle is $\tan^{-1}3$ $k = 3$</p>	<p>B1 B1 M1 A1 [4]</p> <p>M1 A1 A1 [3]</p> <p>B1 B1√ [2]</p> <p>M1 A1 [2]</p>	<p>Ignore + c. Substitution of point after integration. co.</p> <p>Attempt to solve $dy/dx = 0$. x correct. y correct.</p> <p>co. $\sqrt{\quad}$ for correct deduction.</p> <p>Use of $m_1 m_2 = -1$</p> <p>Needs $k = 3$</p>
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q7.

<p>11 (i) $x - \frac{4}{y^2} - 1$</p> <p>(ii) $\int \left(\frac{4}{y^2} - 1 \right) dy - \left[-\frac{4}{y} - y \right]$ Upper limit = 2 $\left[\left(-\frac{4}{2} - 2 \right) - (-4 - 1) \right]$ 1</p> <p>(iii) $(\pi) \int x^2 dy - (\pi) \int \left(\frac{16}{y^4} - \frac{8}{y^2} + 1 \right) dy$ $(\pi) \left[\frac{-16}{3y^3} + \frac{8}{y} + y \right]$ $(\pi) \left[\left(\frac{-16}{24} + 4 + 2 \right) - \left(\frac{-16}{3} + 8 + 1 \right) \right]$ $\frac{5\pi}{3}$</p>	<p>B1 [1]</p> <p>B1B1</p> <p>B1 M1 A1 [5]</p> <p>B1B1</p> <p>B1 M1 A1 [5]</p>	<p>AG At least 1 step of working needed</p> <p>For $-\frac{4}{y}, -y$ Apply limits 1 and <i>their 2</i> 'correctly' SC B2 for $\int 2(x+1)^{-\frac{1}{2}} dx - 3 \rightarrow 1$</p> <p>Apply limits 1 and <i>their 2</i> 'correctly'</p>
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q8.

<p>5 $x - \frac{8}{y^2} - 2$; at $x = 0, y = 2$</p> <p>$\rightarrow x^2 - \frac{64}{y^4} - \frac{32}{y^2} + 4$</p> <p>Integral of $x^2 = \frac{64y^{-3}}{-3} - \frac{32y^{-1}}{-1} + 4y$</p> <p>Uses limits 1 to 2</p> <p>$\rightarrow 6\frac{2}{3}\pi$</p>	<p>B1</p> <p>B1B1B1</p> <p>M1</p> <p>A1</p> <p>[6]</p>	<p>co</p> <p>All co.</p> <p>Uses 1 to 2 or 2 to 1. co.</p>
--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------	---------------------------------------------------------------------------------------

Q9.

<p>9 $\frac{d^2y}{dx^2} = -4x$</p> <p>(i) $\frac{dy}{dx} = -2x^2 + c$</p> <p>$\frac{dy}{dx} = 0$ when $x = 2, \rightarrow c = 8$</p> <p>$y = -\frac{2x^3}{3} + 8x + C$</p> <p>Subs (2, 12) $\rightarrow C = \frac{4}{3}$</p> <p>(iii) $\frac{dy}{dt} = \frac{dy}{dx} \times \frac{dx}{dt}$</p> <p>$= -10 \times 0.05$</p> <p>$\rightarrow$ decreasing at 0.5 units per second</p>	<p>B1</p> <p>B1</p> <p>B1 B1✓</p> <p>M1 A1</p> <p>[6]</p> <p>M1</p> <p>A1</p> <p>[2]</p>	<p>For $-2x^2$</p> <p>$c = 8$</p> <p>For each term -✓ on "c" - ignore (+C)</p> <p>Uses (2, 12) to find C.</p> <p>Must use. Enough to see product of gradient and rate. bod over notation.</p>
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q10.

<p>10 (i) $\frac{dy}{dx} = 4(x-2)^3$</p> <p>Grad of tangent = -4</p> <p>Eq. of tangent is $y - 1 = -4(x - 1)$</p> <p>$\rightarrow B (\frac{5}{4}, 0)$</p> <p>Grad of normal = $\frac{1}{4}$</p> <p>Eq. of normal is $y - 1 = \frac{1}{4}(x - 1) \rightarrow C(0, \frac{3}{4})$</p>	<p>B1</p> <p>M1</p> <p>M1</p> <p>A1</p> <p>M1</p> <p>A1</p> <p>[6]</p>	<p>Or $4x^3 - 24x^2 + 48x - 32$</p> <p>Sub $x = 1$ into <i>their</i> derivative</p> <p>Line thru (1, 1) and with m from deriv</p> <p>Use of $m_1 m_2 = -1$</p>
-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

<p>(ii) $AC^2 - 1^2 + \left(\frac{1}{4}\right)^2$</p> $\frac{\sqrt{17}}{4}$	<p>M1</p> <p>A1</p> <p>[2]</p>	<p>Allow $\sqrt{\frac{17}{16}}$</p>
<p>(iii) $\int (x-2)^4 dx - \frac{(x-2)^5}{5}$</p> $\left[0 - \left(-\frac{1}{5}\right)\right] - \frac{1}{5}$ <p>$\Delta - \frac{1}{2} \times 1 \times (\text{their } \frac{5}{4} - 1) - \frac{1}{8}$</p> $\frac{1}{5} - \frac{1}{8} - \frac{3}{40} \text{ or } 0.075$	<p>B1</p> <p>M1</p> <p>M1</p> <p>A1</p> <p>[4]</p>	<p>Or $\frac{x^5}{5} - 2x^4 + 8x^3 - 16x^2 + 16x$</p> <p>Apply limits $1 \rightarrow 2$ for curve</p> <p>Or $\int_1^4 (-4x+5) dx = \frac{1}{8}$</p>

Q11.

<p>1</p> $\frac{dy}{dx} = \sqrt{2x+5}$ $\frac{(2x+5)^{\frac{3}{2}}}{\frac{3}{2}} \div 2 \quad (+c)$ <p>Uses (2, 5) $\rightarrow c = -4$</p>	<p>B1</p> <p>B1</p> <p>M1 A1</p>	<p>[4]</p> <p>B1 Everything without "+2". B1 "+2"</p> <p>Uses point in an integral.</p>
--------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------	---------------------------------------------------------------------------------------------

Q12.

<p>11</p> $y = \frac{8}{\sqrt{x}} - x$ <p>(i) $\frac{dy}{dx} = -4x^{-\frac{3}{2}} - 1$</p> <p>$= -\frac{3}{2}$ when $x = 4$.</p> <p>Eqn of BC $y - 0 = -\frac{3}{2}(x - 4)$</p> <p>$\rightarrow C(1, 4\frac{1}{2})$</p> <p>(ii) area under curve = $\int \left(\frac{8}{\sqrt{x}} - x\right)$</p> $= \frac{8x^{\frac{1}{2}}}{\frac{1}{2}} - \frac{1}{2}x^2$ <p>Limits 1 to 4 $\rightarrow 8\frac{1}{2}$</p> <p>Area under tangent = $\frac{1}{2} \times 4\frac{1}{2} \times 3 = 6\frac{3}{4}$</p> <p>Shaded area = $1\frac{3}{4}$</p>	<p>B1</p> <p>M1</p> <p>M1</p> <p>A1</p> <p>B1 B1</p> <p>M1</p> <p>M1</p> <p>A1</p>	<p>[4]</p> <p>needs both</p> <p>Subs $x = 4$ into dy/dx Must be using differential + correct form of line at $B(4,0)$.</p> <p>(both unsimplified)</p> <p>Using correct limits.</p> <p>Or could use calculus)</p> <p>[5]</p>
------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q13.

<p>6 $\frac{dy}{dx} = k - 2x$</p> <p>(i) At $x = 2, m = (k - 4)$ $x = 3$ $m = (k - 6)$ $(k - 4)(k - 6) = -1$ $\rightarrow k = 5$</p> <p>(ii) $y = kx - x^2 (+ c)$ Substitutes (4, 9) $\rightarrow c = 5$</p>	<p>M1</p> <p>M1 DM1A1 [4]</p> <p>B1√ M1 A1 [3]</p>	<p>Obtains either gradient as $f(k)$.</p> <p>Uses $m_1 m_2 = -1$ with gradients $f(k)$ Soln of quadratic = 0. co (watch for fortuitous answers)</p> <p>For integration without c Realises need to substitute for x and y co (nb If $k = 5$ is fortuitous, loses last A1)</p>
--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q14.

<p>1 $\int \left(x + \frac{1}{x}\right)^2 dx$ $= \frac{x^3}{3} - \frac{1}{x} + 2x + (c)$</p>	<p>B1 × 3</p>	<p>[3]</p>	<p>co. Omission of middle term of expansion can still get 2/3.</p>
--------------------------------------------------------------------------------------------------------------------------------	---------------	------------	------------------------------------------------------------------------------

Q15.

<p>11 $y = \frac{9}{2-x}$</p> <p>(i) $\frac{dy}{dx} = -9(2-x)^{-2} \times -1$ $\frac{9}{(2-x)^2} \neq 0$. No turning points.</p> <p>(ii) $V = \pi \int \frac{81}{(2-x)^2} dx$ $\int y^2 dx = -81(2-x)^{-1} \div (-1)$ Use of limits 0 to 1 $\rightarrow \frac{81\pi}{2}$ (or 127)</p> <p>(iii) $\frac{9}{2-x} = x + k$ $\rightarrow x^2 - 2x + kx - 2k + 9 = 0$ Uses $b - 4ac$ $\rightarrow k^2 + 4k - 32$ \rightarrow end-points of 4 and -8 Range for 2 points of intersection $\rightarrow k < -8, k > 4$.</p>	<p>B1 B1</p> <p>B1√</p> <p>B1 B1 M1</p> <p>A1</p> <p>M1</p> <p>M1</p> <p>A1</p> <p>A1</p>	<p>[3]</p> <p>[4]</p> <p>[4]</p>	<p>Without the “× -1” Indep. With the “× -1”. Indep.</p> <p>√ provided of form $k \div (2-x)^2$.</p> <p>Answer without the “÷ -1 including π For “÷ -1”.</p> <p>Uses both limits in an integral of y^2 – if “0” ignored, M0.</p> <p>co (If π omitted – max 3/4)</p> <p>Elimination of y</p> <p>Uses discriminant</p> <p>End-values correct.</p> <p>Accept $<, >$.</p>
-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------------------------	----------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q16.

11	(i)	$9 - x^3 - \frac{8}{x^3}$ $x^6 - 9x^3 + 8 = 0$ $(X-1)(X-8) = 0 \rightarrow X = 1 \text{ or } 8$ $a = 1, b = 2$	M1 A1 M1 A1	[4]	Together with attempt to mult by x^3 AG completely correct working Attempt to solve quadratic in X or x^3
	(ii)	$\int_1^2 \left[(9-x^3) - \frac{8}{x^3} \right] dx$ $\left[9x - \frac{x^4}{4} \right] \cdot \left[\frac{-4}{x^2} \right]$ $18 - 4 + 1 - (9 - \frac{1}{4} + 4)$ $2 \frac{1}{4}$	M1 B1 B1 M1 A1		[5]
	(iii)	$\frac{dy}{dx} = \frac{-24}{x^4}, \frac{dy}{dx} = -3x^2$ $\frac{-24}{c^4} = -3c^2$ $c^6 = 8$ $c = \sqrt[6]{8}$ or $8^{1/6}$ or 1.41(4...)	B1, B1 M1 A1		
				[4]	

Q17.

10	(i)	B (0,1) C (4,3)	B1, B1	[2]	if both then SCB1 for both $y = 1$ & $x = 4$
	(ii)	$\frac{\partial y}{\partial x} = \frac{1}{2} \times 2(1+2x)^{-1/2}$ Grad. of normal = -3 $y - 3 = -3(x - 4)$ or $y = -3x + 15$ oe	M1A1 B1 B1√	[4]	$^{-1/2}$ required & at least one of $\frac{1}{2} \times 2$ for M1 Ft only from <i>their</i> C
	(iii)	$y^2 = 1 + 2x \Rightarrow x = \frac{1}{2(y^2 - 1)}$ SOI $(\pi) \times \frac{1}{4} \times \int (y^4 - 2y^2 + 1) \delta y$ $(\pi) \times \frac{1}{4} \left[\frac{y^5}{5} - \frac{2y^3}{3} + y \right]$ $(\pi) \times \frac{1}{4} \left[\frac{1}{5} - \frac{2}{3} + 1 \right]$ $\frac{2}{15} \pi$	B1 M1 A1 DM1 A1	[5]	$\int x^2 \delta y$, square $\frac{1}{2}(y^2 - 1)$ & attempt int^n Apply limits $0 \rightarrow \text{their } 1$ (from <i>their</i> B) cao SCB1 for $\int y^2 \delta x \rightarrow \frac{\pi}{4}$ (scores 1/5)

Q18.

<p>10 (i) $\int((x+1)^2 - (x+1))$ or $\int((y^2 - 1) - (y - 1))$</p> $\frac{2}{3}(x+1)^3 - \frac{1}{2}x^2 - x$ or $\frac{1}{3}y^3 - \frac{1}{2}y^2$ $\frac{2}{3} - \left(0 - \frac{1}{2} + 1\right)$ or $\frac{1}{3} - \frac{1}{2}$ $\frac{1}{6}$ <p>(ii) $V_1 = (\pi) \int (y^2 - 1)^2 = (\pi) \int y^4 - 2y^2 + 1$</p> $(\pi) \left[\frac{y^5}{5} - \frac{2y^3}{3} + y \right]$ $(\pi) \left[\frac{1}{5} - \frac{2}{3} + 1 \right]$ $V_1 = \frac{8}{15}(\pi)$ or 0.533(π) (AWRT)	<p>M1</p> <p>M1A1</p> <p>DM1</p> <p>A1</p> <p>[5]</p> <p>M1</p> <p>A1</p> <p>DM1</p> <p>A1</p>	<p>Dealing with line as a triangle or integral with correct limits.</p> <p>Attempt at integral of curve.</p> <p>Applying limits $-1 \rightarrow 0$ or $0 \rightarrow 1$ to curve</p> <p>π included loses last mark.</p> <p>Attempt at $\int x^2 dy$ for curve</p> <p>Apply limits $0 \rightarrow 1$</p>

Q21.

<p>11 (i) $a = 2$</p> <p>(ii) $y =$</p> <p>$b = \frac{2}{3}$</p> <p>(iii) area = $\int y \, dx = \left[\frac{x^4}{4} + \frac{4x^3}{3} + 2x^2 \right]$</p> <p>$\frac{4}{3}$</p> <p>(iv) $\frac{d^2y}{dx^2} = 6x - 8 = 0 \Rightarrow x = \frac{4}{3}$</p> <p>When $x = \frac{4}{3}, \frac{dy}{dx}$ (or m) =</p>	<p>B1 [1]</p> <p>B1</p> <p>B2, 1, 0 ✓ -1 for eeo</p> <p>B1</p> <p>cao</p> <p>[4]</p> <p>B2, 1, 0 -1 for eeo</p> <p>M1</p> <p>A1 [4]</p> <p>M1 A1</p> <p>DM1 A1 [4]</p>	<p>-1 for eeo</p> <p>cao</p> <p>Apply limits $0 \rightarrow 2$ - ft <i>their a</i> from (i)</p> <p>cao</p> <p>Attempt $\frac{d^2y}{dx^2}$ and set = 0</p> <p>cao</p>
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Q22.

<p>2 Attempt integration</p> <p>$f(x) - 2(x+6)^{\frac{1}{2}} - \frac{6}{x} (+c)$</p> <p>$2(3) - \frac{6}{3} + c - 1$</p> <p>$c = -3$</p>	<p>M1</p> <p>A1A1</p> <p>M1</p> <p>A1 [5]</p>	<p>Accept unsimplified terms</p> <p>Sub. $x = 3, y = 1. c$ must be present</p>
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------	-------------------------------------------------------------------------------------------

Q23.

<p>10 (i) $\frac{dy}{dx} = [3(3-2x)^2] \times [-2]$ At $x = \frac{1}{2}, \frac{dy}{dx} = -24$ $y - 8 = -24\left(x - \frac{1}{2}\right)$ $y = -24x + 20$</p>	<p>B1B1 M1 DM1 A1 [5]</p>	<p>OR $-54 + 72x - 24x^2$ B2,1,0</p>
<p>(ii) Area under curve = $\left[\frac{(3-2x)^4}{4}\right] \times \left[-\frac{1}{2}\right]$ $-2 - \left(-\frac{81}{8}\right)$ Area under tangent = $\int(-24x + 20)$ $- -12x^2 + 20x$ or 7 (from trap) $\frac{9}{8}$ or 1.125</p>	<p>B1B1 M1 M1 A1 A1 [6]</p>	<p>OR $27x - 27x^2 + 12x^3 - 2x^4$ B2,1,0 Limits $0 \rightarrow \frac{1}{2}$ applied to integral with intention of subtraction shown or area trap = $\frac{1}{2}(20 + 8) \times \frac{1}{2}$ Could be implied Dep on both M marks</p>

Q24.

<p>2 $f(x) = 2x^{\frac{1}{2}} + x + c$ $5 = -2 \times \frac{1}{2} + 4 + c$ $c = 2$</p>	<p>M1A1 M1 A1 [4]</p>	<p>Attempt integ $x^{\frac{1}{2}}$ or $+x$ needed for M Sub (4, 5). c must be present</p>
-----------------------------------------------------------------------------------------------------------------------------------	------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------

Q25.

<p>11 (i) $\frac{dy}{dx} = \left[\frac{1}{2}(x^4 + 4x + 4)^{-\frac{1}{2}}\right] \times [4x^3 + 4]$ At $x = 0, \frac{dy}{dx} = \frac{1}{2} \times \frac{1}{2} \times 4 = (1)$ Equation is $y - 2 = x$</p>	<p>B1B1 M1 A1 [4]</p>	<p>Sub $x = 0$ and attempt eqn of line following differentiation.</p>
<p>(ii) $x + 2 = \sqrt{x^4 + 4x + 4} \Rightarrow (x + 2)^2 = x^4 + 4x + 4$ $x^2 - x^4 = 0$ oe $x = 0, \pm 1$</p>	<p>B1 B1 B2,1,0 [4]</p>	<p>AG www</p>
<p>(iii) $(\pi) \left[\frac{x^5}{5} + 2x^2 + 4x\right]$ $(\pi) \left[0 - \left(\frac{-1}{5} + 2 - 4\right)\right]$ $\frac{11\pi}{5}$ (6.91) oe</p>	<p>M1A1 DM1 A1 [4]</p>	<p>Attempt to integrate y^2 Apply limits $-1 \rightarrow 0$</p>
